

Supporting innovation and good practices

The KET4F-Gas project team has prepared two guiding documents to support F-gas industry and both public and private waste managers for better practices and to clear the path towards a more green sector. These are available on the project website in four languages (EN, ES, PT, FR).

Good practices handbook for industry and waste managers

An overview of the current situation of F-gases and the road from policy to market is the starting point of this guide to understand better how to achieve an efficient and greener sector. KET4F-Gas innovations are presented as part of the solutions to minimise F-gases emissions and promote circular practices, with long-term benefits for both F-gas waste managers and operators.

Roadmap for the Public Administrations in charge of waste management

Environmental legislative obligations must involve the entire value chain. This is the only way to promote sustainable behaviour in industry and citizens. Public administrations are key players in these complex tasks and in ensuring their success. Therefore, this roadmap aims to guide them towards better practices through the contextualization of F-gas waste management in a broader context and several recommendations to support all stakeholders involved.

Finance Scheme Catalogue

Thanks to national and international funding programmes, all actors in society can contribute to achieving sustainability goals and take advantage of Europe's strong innovation capacity. In addition, a wide range of financial support is available for public and private entities to implement better strategies and adapt waste facilities, promoting circular resource management models. The KET4F Gas Financing Scheme covers both areas and encourages stakeholders to connect science, industry and citizens.
